mangOH™ Red

Getting Started—WPx5xx + Windows VM + CLI
Important Notice

Due to the nature of wireless communications, transmission and reception of data can never be guaranteed. Data may be delayed, corrupted (i.e., have errors) or be totally lost. Although significant delays or losses of data are rare when wireless devices such as the Sierra Wireless modem are used in a normal manner with a well-constructed network, the Sierra Wireless modem should not be used in situations where failure to transmit or receive data could result in damage of any kind to the user or any other party, including but not limited to personal injury, death, or loss of property. Sierra Wireless accepts no responsibility for damages of any kind resulting from delays or errors in data transmitted or received using the Sierra Wireless modem, or for failure of the Sierra Wireless modem to transmit or receive such data.

Limitation of Liability

The information in this manual is subject to change without notice and does not represent a commitment on the part of Sierra Wireless. SIERRA WIRELESS AND ITS AFFILIATES SPECIFICALLY DISCLAIM LIABILITY FOR ANY AND ALL DIRECT, INDIRECT, SPECIAL, GENERAL, INCIDENTAL, CONSEQUENTIAL, PUNITIVE OR EXEMPLARY DAMAGES INCLUDING, BUT NOT LIMITED TO, LOSS OF PROFITS OR REVENUE OR ANTICIPATED PROFITS OR REVENUE ARISING OUT OF THE USE OR INABILITY TO USE ANY SIERRA WIRELESS PRODUCT, EVEN IF SIERRA WIRELESS AND/OR ITS AFFILIATES HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES OR THEY ARE FORESEEABLE OR FOR CLAIMS BY ANY THIRD PARTY.

Notwithstanding the foregoing, in no event shall Sierra Wireless and/or its affiliates aggregate liability arising under or in connection with the Sierra Wireless product, regardless of the number of events, occurrences, or claims giving rise to liability, be in excess of the price paid by the purchaser for the Sierra Wireless product.

1: Introduction

Now that you have your mangOH™ Red, it’s time to start using it!

**Important:** Use this guide only if you are using a Windows computer (dev(elopment) machine). This guide includes instructions for Windows® dev machines using CLI (Command Line Interpreter).

Use this guide to:
- Assemble your mangOH Red
- Set up your dev machine for mangOH development
- Install and run applications, and send data to the IoT Cloud via AirVantage, Sierra Wireless’ cloud-based service platform for over-the-air (OTA) device management.

To get started with a native Linux dev machine, or for other mangOH Red resources (guides, tutorials, etc.), visit mangoh.io/mangoh-red-resources.

1.1 Get Started!

**Important:** Follow all steps as described. If you skip, change, or ‘jump around’ steps, your device or development environment may not work properly.

Before you begin, make sure your dev machine meets the minimum suggested requirements in Table 1-1 on page 7 for mangOH Red application development.

**Note:** The instructions in this guide have been tested using the Legato Virtual Machine with a 64-bit Ubuntu 16.04 guest OS, available at mangoh.io/mangoh-red-resources-getting-started. If you use a different configuration and need assistance, please check out the forum at forum.mangoh.io.
When you are ready to begin, work straight through the rest of this guide:

- **STEP 1:** Check Out Some Helpful Tips on page 8
- **STEP 2:** Set Up Your mangOH Red Hardware on page 9
- **STEP 3:** Prepare Your Windows Dev Machine For Legato Development on page 15
- **STEP 4:** Prepare Your mangOH Red For Development on page 20
- **STEP 5:** Connect To Mobile Networks on page 25
- **STEP 6:** Connect to the IoT Cloud on page 29

Things to check out after you finish the steps above:

- Develop and Test applications on page 37
- Update Legato Application Framework on page 45
- Tips on page 48
- Hardware Tips on page 53
- Console Access on page 54
- Quick Reference—Commands in this Guide on page 58

### Table 1-1: Minimum System Requirements

<table>
<thead>
<tr>
<th>O/S</th>
<th>Windows 7 and higher (64-bit)</th>
</tr>
</thead>
<tbody>
<tr>
<td>CPU</td>
<td>Dual core @ 2.6 GHz</td>
</tr>
<tr>
<td>RAM</td>
<td>4 GB</td>
</tr>
<tr>
<td>HDD</td>
<td>10 GB free space</td>
</tr>
</tbody>
</table>
| USB Ports            | • Preferred—2 (for full functionality)  
                        • Minimum—1                      |
2: Check Out Some Helpful Tips

Before you begin, here are a few items that you might find helpful:

- **Some terminology:**
  - "CF3"—The mangOH Red supports CF3 (Common Form Factor) embedded modules, such as the WP8548 and HL8548. Throughout this tutorial, "CF3" refers to the module that comes with your mangOH Red kit.
  - "Dev(elopment) machine"—Your Legato VM with Ubuntu 16.04 guest OS.
  - "Target"—The CF3 module in your mangOH Red.

- **Some symbols:**
  - '$', '#': Command prompts.
    - '$': Command prompt when you are logged in to a device as a regular user.
    - '#': Command prompt when you are logged in as the 'root' user.

  Note: In the examples in this document, you will be logged in as a regular user on your dev machine (command prompt will be '$'), and logged in as the root user on the target (command prompt will be '#').

  - '>'—Command is entered on the Windows computer
  - '~', "$HOME"—Your 'home directory' on your dev machine.

- **Command examples**—Many steps in this guide require you to enter commands in a terminal window. These commands are shown like this:

  ```
  $ ping 192.168.2.2
  # cd ~
  ```

  Note: You can copy commands from this guide and paste them into your terminal window to save time and avoid typing errors. Copy the command only, do not include the command prompt. (In the first example above, you would enter "ping 192.168.2.2", not "$ ping 192.168.2.2".)

- **CF3 module default credentials and IP address (used to connect to the target from the dev machine):**
  - USB ECM IP address—192.168.2.2
  - User name—root
  - Password—<none>

- **VM password**—mangoh. You will need to use this to unlock the VM if you manually lock it.

- **Terminal window tips:**
  - Shortcut to open a terminal window (on the default Unity desktop used in Ubuntu Linux)—Ctrl+Alt+T
  - Cancel command to break out of a running process—Ctrl+C
3: Set Up Your mangOH Red Hardware

In this chapter, you will set up your mangOH Red to begin developing applications.

A typical mangOH Red kit includes:
- mangOH Red board
- Pre-installed CF3 (Common Form Factor) module and cover, and release tool
- micro-USB cables (2)
- Antenna (main)
- Antenna (diversity)—Included if the CF3 module supports LTE
- Sierra Wireless micro-SIM

The following image summarizes the parts of the mangOH Red that you will set up when you follow the instructions in Hardware Setup on page 10.

**Important:** Do not start connecting components until told to in the instructions, otherwise you may encounter problems later in the guide.
3.1 Install Drivers

Your Windows computer requires drivers for your mangOH Red’s CF3 module. To download and install the drivers:

2. In the Getting Started with mangOH section, find and click Drivers for mangOH-compatible CF3 Modules. This takes you to the drivers page on the Source.
3. Click Download.

   **Note:** You must register on the Source for an account before you can download files.

4. Open the downloads folder.
5. Run (double-click) GenericDriverSetup.exe and follow the prompts to install the drivers.

3.1.1 Install PuTTY terminal emulator

You need a terminal emulator to establish SSH connections to the mangOH Red:

1. If you do not have a terminal emulator on your computer that supports SSH, go to https://www.chiark.greenend.org.uk/~sgtatham/putty/latest to download and install the PuTTY SSH client.

3.2 Hardware Setup

To set up the mangOH Red board:

1. Remove the protective film from the dipswitches:
2. Make sure the dipswitches are set as follows:
   - **ON** — 1, 3, 5, 8
   - **OFF** — 2, 4, 6, 7

For switch details (not needed for this tutorial), see Dipswitch Settings on page 53.

3. Insert a micro-SIM in the slot on the bottom side of the mangOH Red. You can use the Sierra Wireless micro-SIM that is included in the kit, or another micro-SIM that has been activated by a mobile network provider.

   **Note:** If you do not have an activated micro-SIM, you can still continue with the tutorial, but will not be able to complete the following sections: Connect To Mobile Networks on page 25 and Connect to the IoT Cloud on page 29.
3.2: Hardware Setup

4. Attach the main antenna and (for LTE CF3 modules) the diversity antenna.

**Note:** The main antenna is required if you want to connect the mangOH Red to a mobile network in Connect To Mobile Networks on page 25.

**Tip:** If you have trouble connecting an antenna, make sure it is positioned directly on the connector and push straight down. The antenna will not connect at an angle.

**Note:** The mangOH Red has two USB connectors:
- CF3 USB is used for SSH connections, AT commands, and firmware downloads.
- CONSOLE_USB is a serial connection used to access the module’s console for diagnostic purposes.

5. Move the power select jumper onto the pins closest to the battery connector to select the CF3 USB connector. (In this guide, power is supplied from the dev machine’s USB port to this connector when you connect it in a later step.)
6. Power up the mangOH Red:
   a. Use a micro-USB cable to connect the CF3 USB connector to a USB port on the dev machine. When the mangOH Red is powered, the Power LED turns solid green.

Note: OPTIONALLY, if you want to be able to display the target’s console messages (diagnostic messages) and have two available USB ports on your dev machine, follow the instructions in Console Access on page 54. This is NOT a required step for this tutorial.

Note: For future reference, the mangOH Red’s power supply (USB port on your dev machine, or an AC adapter) connects to the board via either USB connector—CF3 USB or CONSOLE USB (depending on the jumper position on the power header). If an AC adapter is connected to CF3 USB, SSH/AT connections are not possible; if it is connected to CONSOLE USB, serial USB connections are not possible.
b. Wait until the device enumerates (1 to 4 minutes)—Hover your cursor over the network status icon. When the device enumerates, this shows that you are connected to an “Unidentified Network” (your CF3 module) with “No Internet access” (because the module is not connected to a mobile network).

c. Open a Windows terminal window—press Win+R (or Start > Run), then enter “cmd” and press Enter.

d. Test the connection by ‘pinging’ the CF3 module (which has a default IP address of 192.168.2.2):

```
> ping 192.168.2.2
```

You should receive ping responses. Press Ctrl+C to return to the command prompt.

Now you are ready to Prepare Your Windows Dev Machine For Legato Development.
4: Prepare Your Windows Dev Machine For Legato Development

In this chapter, you will prepare your dev machine for Legato application development by installing Oracle VirtualBox (a ‘hypervisor’ (virtual machine monitor)) and a custom pre-configured virtual machine (VM) image.

**Important:** To install and use the development environment, your dev machine must meet the requirements in *Table 1-1 on page 7.*

**Note:** The Legato development environment runs in a Legato Virtual Machine on your Windows computer. Compared to running natively on a Linux computer, its performance is decreased (typically) due to the overhead of running the virtual machine, but functionality is the same on both computer types.

### 4.1 Prepare Your Computer

After preparing your mangOH Red in *Set Up Your mangOH Red Hardware on page 9,* including installing drivers on your computer and connecting the mangOH Red, you can prepare your computer for Legato development.

Your computer requires a virtual machine image configured with the Legato development environment. The following sections describe how to get and install the virtual machine.

#### 4.1.1 Install Oracle VirtualBox

The VM image provided for mangOH Red is built for use with Oracle VirtualBox. If you do not have Oracle VirtualBox installed on your computer yet:

1. Go to https://www.virtualbox.org to download the VirtualBox binary for Windows hosts.

   **Note:** When you install VirtualBox, default settings will work, but you can modify them if you prefer (see *VirtualBox Tips on page 51* for details.)

2. Install VirtualBox by running the downloaded file.

   VirtualBox opens automatically when it finishes installing.

   **Note:** VirtualBox appears in your Start menu as “Oracle VM VirtualBox”.

#### 4.1.2 Download Legato Application Development Image

The guest OS on the VM image provided for mangOH Red is 64-bit Ubuntu Linux 16.04, pre-loaded with the Legato toolchain (tools for building Legato applications), and files for building the mangOH Red platform.

**Important:** Download, installation and use of Legato Application Framework and Platform Services is subject to the *Legato License* and *Open Source Licenses.* (Note: These links automatically download the licenses as PDF files.)
To download the VM image:
2. In the Legato Virtual Machines section, locate and click Download VM.

   **Note:** The VM image size is ~2.1 GB.

3. Load (import) the Legato VM into VirtualBox:
   a. In VirtualBox, select File > Import Appliance.
   b. Browse to the local folder where you downloaded the VM image (for example, “mangOH-Legato-17_06-Ubuntu-16_04.ova”), select the file, and click Open.
   c. Click Next.

      VirtualBox opens and displays the Import Virtual Appliance window.

      ![Image of Import Virtual Appliance window](image)

   d. If you want to assign a different name to the VM, double-click the Configuration field beside the Name, type the new name, and press Enter.
   e. Click Import. The Linux VM begins importing into VirtualBox—this may take up to 10 minutes to run, depending on your computer.
4. Make sure the Legato VM is set up to use the Internet connection:
   a. In the VirtualBox window, click Settings. The Settings window appears.
   b. Select Network.
   c. Select Adapter 1.
   d. Click Advanced.
   e. Select Cable Connected.
   f. Click OK.
5. Check whether your computer has virtualization enabled (which allows you to run the Linux VM):
   a. In the VirtualBox window, click Settings. The Settings window appears.
   b. Select System.
   c. Try to select Acceleration:
      - If Acceleration cannot be selected (grayed out):
         i. You must enable virtualization in your computer’s BIOS. See C.6 Enable virtualization on a Windows computer on page 51 for details.
         ii. After you reboot, launch VirtualBox from your Start menu, and repeat Step 5.
      - If Acceleration can be selected:
         i. Make sure both Hardware Virtualization options are selected.
         ii. Click OK.
6. In the VirtualBox window, launch (double-click, or click to select and click Start) the virtual machine (for example, “mangOH Dev using Legato ...”).

As VirtualBox begins to load the image, one of the following will happen:

- A VirtualBox window should appear, showing progress messages as the image loads. This may take a few minutes before the Ubuntu desktop appears.
  
  If prompted to enter the mangOH password, type “mangoh” and press Enter.

- If a VirtualBox Error appears with the message “VT-x/AMD-V hardware acceleration is not available on your system...”, you must enable virtualization in your computer’s BIOS. See C.6 Enable virtualization on a Windows computer on page 51 for details.

- If the image doesn’t load properly (the program hangs, or the desktop does not appear), you must:
  
  i. Close VirtualBox.
  ii. Start VirtualBox.
  iii. Delete the VM image.
  iv. Re-import the VM image—repeat Download Legato Application Development Image on page 15, beginning at Step 3 on page 16.

**Important:** The Linux VM will not lock if it is left unused. However, if you manually lock it, the password to unlock it is ‘mangoh’.

Now that the VM is loaded and running and you have a terminal emulator installed, you can Prepare Your mangOH Red For Development on page 20.
5: Prepare Your mangOH Red For Development

In this chapter, you will update the CF3 module on your mangOH Red with the basic mangOH Red Platform (application suite).

5.1 Build and Install Legato Platform and mangOH Red Platform on Target

Now that your dev machine is set up with the Legato VM (which has Legato already pre-installed and configured), you will:

- Build the Legato Platform (development applications) on your dev machine.
- Use the Legato Platform to build the mangOH Red Platform (target applications) and install it onto your target (the CF3 module in your mangOH Red)

**Important: You MUST do the following step!** The Legato Application Framework and the mangOH Red platform apps that you are going to install in this procedure both require you to have the correct (latest) firmware installed on your CF3 module. The platform apps will not install if you do not have the correct firmware.

1. Update the target’s firmware to the latest available version:
   a. Go to [https://source.sierrawireless.com](https://source.sierrawireless.com) and do the following:
      i. In the Devices section, click AirPrime.
      ii. Click WP series.
      iii. Click your module type.
      iv. In the Software download section, click Firmware to display the list of available firmware packages.
      v. If you did not load the latest Drivers for your module yet, load them now—see Install Drivers on page 10 for instructions.
      vi. In the Combined Images table, click the Download link in the Windows EXE column for the Generic carrier.
   b. Run the downloaded file and follow the instructions that appear.

   **Note:** This will take several minutes to run.

   ![Image](image.png)

   c. Wait (1–2 minutes) while the module reboots with the new firmware.
5.1: Build and Install Legato Platform and mangOH Red Platform on Target

d. Verify that the firmware updated:
   i. Connect to the mangOH Red:
      
      $ ssh root@192.168.2.2
   
      ii. The following message appears if you are using your CF3 module for the first time (modules are shipped without a password).

      It is strongly recommended to setup credentials for remote
      
      Please select one of the following options:
      
      1) Setup ssh keys and disable passwords-based authentication
      2) Setup password (better than nothing)
      3) Do nothing

      For now, type 3 and press Enter, then type Y and press Enter to be reminded the next time you connect.

      Note: After completing this tutorial, you should select an appropriate login authentication method (ssh keys or password) from this menu—see legato.io/legato-docs/latest/basicTarget.html for details.

   iii. Display information about the CF3 module and confirm that the Firmware version shown is the one that you downloaded:

      # cm info

      iv. Disconnect from the mangOH Red:

      # exit

2. In the VM, open a terminal window and then build the Legato Application Framework (AF):

      $ cd ~/legato_framework/legato
      $ make clean   # Optional step to remove clutter from previous builds
      $ make wp85   # Build the framework

      Note: You don’t need to use make clean’ the first time you use this procedure to build the Legato AF. If you have to redo the procedure for some reason, use this command to clear out build artifacts (files generated and stored by the ‘make wp85’ command.)
3. To use the Legato AF’s tools in the terminal window, enter the following command to set the required configurations (this is a shortcut command to run a command deeper in the framework files):

   $ cfglegato  # Set up the environment

**Important:** You must enter the `cfglegato` command in any terminal window that you open on the dev machine, if you want to use the framework’s tools in that window.

4. Change directory to the mangoh work directory:

   $ cd $MANGOH_ROOT

5. The VM is pre-installed with the files for the mangOH Red platform. However, you should make sure you have the latest versions of the files using the following git (version control system) commands:

   a. Get the latest files:
   
   $ git pull

   b. Update the git configuration with any new submodules added recently:
   
   $ git submodule init

   c. Check out the correct version for all of the submodules:
   
   $ git submodule update

6. Build the mangOH Red platform:

   $ make red_wp85

   
   Note:  • This may take several minutes to run.
   • The number of packages listed will vary (newer platform releases will have different numbers of files).
5.1: Build and Install Legato Platform and mangOH Red Platform on Target

**Note:** In the command "make red_wp85", 'wp85' indicates the target type on which the applications will run. If a different module type is used, the make command must be modified to indicate the correct type. For example, if the CF3 module is a WP7602, the target must be changed from "wp85" to "wp76". This applies to all make commands described in this guide.

7. Verify that the update file mangOH_Red.wp85.update was created:

   ```bash
   $ ls -al *update
   ```

   ![Command output showing the update file](image)

8. Make sure the mangOH board is powered on and is connected to your dev machine—the board is connected if you receive ping responses:

   ```bash
   $ ping 192.168.2.2
   ```

   Press Ctrl+C to return to the command prompt.

9. Install the mangOH_Red platform on your mangOH board:

   ```bash
   $ instsys mangOH_Red.wp85.update 192.168.2.2
   ```

   If the applications install successfully, the last message shown will be **SUCCESS Done**.

   **Note:** If the target has any problems starting the mangOH Red platformat applications, it automatically reboots and restores to its original state (prior to the instsys command). If this happens, the target will not be reachable while it is rebooting.

10. Verify the mangOH platform apps installed correctly:
    
    a. Connect to the mangOH Red:

       ```bash
       $ ssh root@192.168.2.2
       ```

    b. Show the list of installed apps to confirm the build and install succeeded:

       ```bash
       # app status
       ```

       If the following apps appear in the list, the build and install succeeded:
5.1: Build and Install Legato Platform and mangOH Red Platform on Target

![Image of terminal output]

If `gpioExpanderServiceRed`, `mqttClient`, and `redSensorToCloud` are listed, the install succeeded.

c. Disconnect from the mangOH Red:

```
# exit
```

Now that the mangOH Red platform is installed, you will learn how to Connect To Mobile Networks on page 25.
6: Connect To Mobile Networks

In this chapter, you will learn how to connect the mangOH Red to a mobile network. When the mangOH_Red has a data connection, you can transmit data, including on-board sensor readings, to the IoT cloud.

6.1 Connect To a Mobile Network

To connect to a mobile network, you must have an activated micro-SIM in the mangOH Red.

1. If you do not have a micro-SIM in the mangOH Red, insert one before continuing:
   a. Disconnect the power from the mangOH Red (remove the jumper from the power header, or unplug the micro-USB cable that is providing power).
   b. Insert a micro-SIM in the slot on the bottom side of the mangOH Red. You can use the Sierra Wireless micro-SIM that is included in the kit, or another micro-SIM that has been activated by a mobile network provider.
   c. Reconnect the power (plug in the micro-USB cable or insert the jumper on the power header on the same pins it was removed from in step a. The Power LED will light immediately.

   **Note:** You must disconnect the power before switching SIMs so the mangOH_Red can detect the SIM while powering on.

2. Connect to the target:
   a. On the dev machine, open a terminal window.
   b. Connect to the target:
      
      ```
      $ ssh root@192.168.2.2
      ```
3. Display the status of the target’s radio:

   # cm radio

   **Example response when Power is OFF**
   ```
   root@swi-mdm9x15:--# cm radio
   Power: OFF
   Current Network Operator:
   Status: Not registered and not currently searching for new operator (LE_MRC_REG_NONE)
   Signal: No signal strength (0)
   PS: Packet Switched Unknown state (LE_MRC_REG_UNKNOWN)
   ```

   **Example response when Power is ON, Status is Searching**
   ```
   cm@swi-mdm9x15:--# cm radio
   Power: ON
   Current Network Operator:
   Status: Not registered but currently searching for a new operator (LE_MRC_REG_G_SEARCHING)
   Signal: No signal strength (0)
   PS: Packet Switched Unknown state (LE_MRC_REG_UNKNOWN)
   ```

   **Example response when Power is ON, Status is Registered**
   ```
   cm@swi-mdm9x15:--# cm radio
   Power: ON
   Current Network Operator: Rogers Wireless
   RAT: UMTS network (LE_MRC_RAT_UMTS)
   Status: Registered to a roaming network (LE_MRC_REG_ROAMING)
   Signal: Good signal strength (5)
   PS: Packet Switched Registered, home network (LE_MRC_REG_HOME)
   ```

   **Important:** Typically, your module will register on a network in < 1 minute. However, the very first time your CF3 module and Sierra SIM are used, registration may take from 5–20 minutes.

4. If the:
   - Power is OFF—Turn on the radio and then repeat **Step 3**:
     ```
     # cm radio on
     ```
   - Power is ON and Status is "... searching ..."—Wait 10–15 seconds while the radio searches for a network to register on, then repeat **Step 3**.
   - Power is ON and Status is Registered—Continue to **Step 6**.

5. Make sure the SIM card is installed correctly:

   # cm sim info

   ```
   root@swi-mdm9x15:--# cm sim info
   Type: EXTERNAL_SLOT_1
   ICCID: 89362728825964668820
   Home Network Operator: Rogers Wireless
   IMSI: 302728826466882
   Phone Number: 15553653284
   ```

   Your SIM data should appear as shown above.

   **Note:** The Home Network Operator is the ISP that provides the network on which the target is connected. This may be different than the provider of the SIM if you are connecting to a network that your SIM’s provider has an agreement with. For example, Sierra Wireless SIMs will connect to a variety of networks as in the example above.
6. Set the target to use IPv4 addressing (this is required for use with AirVantage later in the guide):

   ```
   # cm data pdp ipv4
   ```

7. Check the connection status:

   ```
   # cm data
   ```

   ![Example response when Not connected, APN is set](image1)
   ![Example response when Not connected, no APN](image2)

a. If "Connected" is:
   - "no", and APN has a value—The mangOH Red is ready to connect to the network. Go to Step 8 on page 28.
   - "no", and APN is blank—You must set the APN. Continue to the next step (step b).

b. If you need to set the APN for:
   - A Sierra Wireless SIM—Enter the following command:
     ```
     # cm data apn internet.sierrawireless.com
     ```

     **Note:** The APN for the Sierra Wireless SIM is internet.sierrawireless.com.

   - Other SIM:
     i. Replace "<your apn>" with the actual APN in the following command:
        ```
        # cm data apn <your_apn>
        ```

        ![Example response when Not connected, APN is set](image1)
        ![Example response when Not connected, no APN](image2)

     **Note:** If your mobile network operator uses different APNs for 3G and LTE, make sure to use the APN for the correct network based on your CF3 module type. For example, the WP8548 is a 3G-only module that does not support LTE—the APN for the network operator’s 3G network should be used.

     If you do not know the APN for your SIM:
     i. Search the Internet for the APN for your Home Network Operator that you showed in Step 5 (for example, search for "Rogers Wireless").
        ii. Set the APN as described above.

c. Check the connection status again to make sure you set the APN correctly:

   ```
   # cm data
   ```
8. The target is registered on a mobile network, and the SIM is installed and configured with the correct APN. You are now ready to transmit data to the IoT cloud.

In the next section—Connect to the IoT Cloud on page 29, you will set up your free account on the Sierra Wireless AirVantage IoT Acceleration Platform and begin sending data to the 'cloud'.

```
root@swl-mdm9x15:~# cm data apn internet.sierrawireless.com
root@swl-mdm9x15:~# cm data
Index:   1
APN:     internet.sierrawireless.com
PDP Type: IPV4
Connected: no
```
7: Connect to the IoT Cloud

In this section, you will register your device with Sierra Wireless' AirVantage IoT Acceleration platform (a cloud-based service to collect data from your device), and begin submitting your mangOH Red's on-board sensor data.

7.1 Register and connect to AirVantage

Your mangOH Red kit includes a free account on the AirVantage IoT Acceleration Platform for your CF3 module. This platform provides Sierra Wireless’ cloud-based services for over-the-air (OTA) device management and application enablement. These services provide the infrastructure for you to build, connect, and operate your IoT applications in a single platform.

**Note:** You can register up to five devices (CF3 modules and other supported devices) on your free account.

To use AirVantage, you must register your device and then connect your mangOH Red to the AirVantage server.

7.1.1 Register with AirVantage

1. In a browser, go to [https://eu.airvantage.net/accounts/signup?type=Mangoh](https://eu.airvantage.net/accounts/signup?type=Mangoh).
2. In the MangOH Signup area, enter your:
   - First and last names
   - Email address—Address to use as your AirVantage username.

   **Important:** Use a valid address—This is your username for accessing AirVantage, and is needed to complete the registration process.

   - Account name—A descriptive name to identify this AirVantage account. Use a unique name such as a combination of your company name, the project name, your name, etc.
   - Phone number—Use international format (for example, for North American phone numbers, use "001" plus the 10-digit area code and phone number).

3. Review the Terms of Service and select "I agree to the Terms of Service".
4. Click Signup.
   An email is sent automatically to your email address with a confirmation link.
5. Open the email and click the link to confirm your signup request.
6. When your browser opens to confirm the signup request, enter a password that satisfies the requirements shown on-screen, and re-enter it to confirm.

7. Click Save.
   If your password is acceptable, the AirVantage Login screen appears.

8. Enter your account’s email address and password, and click Log In.

9. If you did not record your device’s FSN and IMEI earlier (in Build and Install Legato Platform and mangOH Red Platform on Target on page 20):
   a. Open a terminal window and connect to the device:
      $ ssh root@192.168.2.2
   b. Display the device information (including the FSN and IMEI):
      # cm info
10. In the Register mangOH window in your browser, enter your device’s information:

- Serial Number—Enter the module’s FSN.
- IMEI/ESN—Enter the module’s IMEI.
- Name—(Optional) Enter a descriptive name for the device (e.g. "Test Device 1", “Parking Meter", etc.)
- Pre-configure system—(IMPORTANT) Do NOT select this option.

11. Click Register.

The device appears in the 'Registered systems' section at the bottom of the screen.

12. Now that your device is registered, click the monitor icon at the right side of your device entry (III) (or click Monitor at the top of the screen and select Systems) to go to the System Details screen (see next step).

13. The System Details screen displays widgets reporting information about your device, communications received from it, running applications, etc.

The areas shown below (Last Communication and System Info) are both blank because you have not connected your mangOH Red to AirVantage yet. Leave this browser window open and continue to Connect to AirVantage on page 33.
7.1.2 Connect to AirVantage

Now that you are registered on AirVantage, connect your mangOH Red to the AirVantage server and begin transmitting data:

1. On the dev machine, open a terminal window.
2. Connect to the mangOH Red:
   
   ```bash
   $ ssh root@192.168.2.2
   ```
3. The mangOH Red platform that you installed earlier includes an application that reports sensor data from your mangOH Red to the IoT cloud. Start the application to send data to AirVantage, and confirm that it started running:
   
   ```bash
   # app start redSensorToCloud
   # app status
   ```

   ![System Info](image)

   **Note:** `redSensorToCloud` automatically opens a data connection, so you do not need to use "cm data connect".
4. In your browser, refresh the AirVantage System Details screen. The System Info section now shows details about your module, and the Last Communication section shows your Registration connection or sensor data, whichever was most recently received.
5. To see details on all transmissions received, click Timeline.

Timeline has sorting options to choose the data to display. This example shows the two most recent sets of sensor data. The second set is expanded to show each sensor reading.

6. To stop sending data, and to confirm the app has stopped:

```
# app stop redSensorToCloud
# app status
```

Note: `redSensorToCloud` automatically closes the data connection, so you do not need to use "cm data connect -1".
You have now registered and connected your device to AirVantage, and completed the mangOH Red Getting
Started tutorial. For more information on the mangOH platform, visit mango.h.io.

To begin developing simple applications or modifying existing applications, work through the examples in Develop
and Test applications on page 37.
A: Develop and Test applications

In this section, you will learn how to develop applications in the Legato development environment, install them onto your mangOH Red, and test that they run.

Legato provides two interfaces for developing applications:

- CLI—Command Line Interpreter in a terminal window.
- Developer Studio—A GUI (Graphical User Interface) development environment.

This section describes development using CLI.

**Note:** You will be updating application source code in this section. Use whichever editor you prefer—these instructions do not refer to a specific editor.

**Note:** This tutorial touches on the basics of using the Legato development environment. After completing the examples in this chapter, see [http://legato.io/legato-docs/latest/mangOH_developers.html](http://legato.io/legato-docs/latest/mangOH_developers.html) for detailed references, forums, etc.

A.1 Develop using the CLI—Command Line Interpreter

A.1.1 Configure the Dev Machine’s Terminal Windows for Development

**Note:** If you installed Legato to a subdirectory of your home directory using a different name than 'legato', replace "~/<yourDirectory>" in the commands in this section.

To use the CLI in a terminal window to compile and build applications, you must configure the window to work with Legato tools.

Each time you open a new terminal window, do the following:

1. Configure the window:

   $ cfglegato

   No toolchain found for target 'ar7'.
   Unable to find compatible cross-build toolchain for target 'ar7'.
   No toolchain found for target 'ar86'.
   Unable to find compatible cross-build toolchain for target 'ar86'.

   **Note:** One thing the command does is check to see which toolchains you have on your development machine and warn you about any that are missing. Since you have loaded only the wp85 toolchain, warnings appear about the others. You can ignore these messages.

   Ignore these toolchain warnings:
2. Confirm that the environment was set correctly:

   $ echo $LEGATO_ROOT

   If a directory path appears, the command worked. If no value was returned, there was a problem with the command—make sure that you entered the alias correctly, using the actual directory name that you used to install Legato.

   **Note:** You can also use the command "~/.legato_framework/legato/bin/legs" to configure the terminal, but this starts a new shell session—your command history and any environment variables you have set will be lost.

---

### A.1.2 Update an Installed Application

As you saw when you set up your AirVantage account, one of the mangOH platform applications loaded on your device in *Build and Install Legato Platform and mangOH Red Platform on Target on page 20* was redSensorToCloud. This application reports sensor readings to the cloud (e.g. AirVantage) every two minutes.

In this section you will increase the reporting frequency of the redSensorToCloud application and install the new version on the mangOH Red.

To update redSensorToCloud:

1. On the dev machine, open a new terminal window.
2. Configure the window for development:

   $ cfglegato

3. Change directory to the folder containing the application’s source code:

   $ cd $MANGOH_ROOT/apps/RedSensorToCloud

4. The source code components for this application are in two sub-folders—avPublisherComponent and sensorsComponent. The code that controls the publishing frequency is in avPublisherComponent—change directory to that folder:

   $ cd avPublisherComponent

5. Open and edit the source code (avPublisher.c) with your preferred editor—two values must be updated to adjust the reporting frequency:

   a. Search for the variable declaration for MaxIntervalBetweenPublish.

      ```c
      static const int MaxIntervalBetweenPublish (120)
      ```

   b. Change the interval value to 30—This increases the reporting frequency to at least once every 30 seconds from once every 120 seconds.

   c. Search for the variable declaration for TimeToStale.

      ```c
      static const int TimeToStale (60)
      ```

   d. Change the stale value to 30—This decreases the length of time a sensor reading is considered to be 'current' before a new sensor reading must be taken.

   e. Save your changes and exit the editor.

   At this point, you have modified the redSensorToCloud application’s source code. Now you have to build (compile) it.
This application was created as part of the mangOH Red platform; to rebuild the application, you will rebuild the whole platform. This method is suggested when applications may interact with each other. If only one application is rebuilt, it may not work properly with other applications that it depends on (or that depend on it).

To rebuild mangOH Red platform, including redSensorToCloud with your changes, and install it onto your mangOH Red:

6. **Build and install the mangOH Red platform:**

   ```
   $ cd $MANGOH_ROOT
   $ make red_wp85
   ```

   ```
   configure: creating ./config.status
   config.status: creating Makefile
   config.status: creating doc/Makefile
   config.status: creating doc/Doxyfile
   config.status: creating tests/Makefile
   config.status: creating platform-specific/Makefile
   config.status: creating sha2/Makefile
   config.status: creating ecc/Makefile
   config.status: creating dts_config.h
   config.status: creating tinydts.h
   [965/205] Packaging system
   ```

   **Note:** This may take several minutes to run.

   **Note:** This ‘make’ command uses the Makefile in $LEGATO_ROOT to build the entire system.

7. **Verify that the update file mangOH_Red.wp85.update was created:**

   ```
   $ ls -al *.update
   ```

8. **Make sure the mangOH board is powered on and is connected to your dev machine—the board is connected if you receive ping responses:**

   ```
   $ ping 192.168.2.2
   ```

   Press Ctrl+C to return to the command prompt.
9. Install the mangOH Red platform on your mangOH board:

   $ instsys mangOH_Red.wp85.update 192.168.2.2

   If the applications install successfully, the last message shown will be "SUCCESS Done".

   **Note:** If the target has any problems starting the mangOH Red platform applications, it automatically reboots and restores to its original state (prior to the instsys command). If this happens, the target will not be reachable while it is rebooting.

10. After the installation is done, open a terminal window and connect to the mangOH Red:

    $ ssh root@192.168.2.2

11. By default, redSensorToCloud is installed but not started. Start the application to send data to AirVantage:

    # app start redSensorToCloud

   **Note:** redSensorToCloud automatically opens a data connection, so you do not need to use "cm data connect".

   In your AirVantage account, you will start to see sensor reports appearing on your new schedule—on the Timeline screen you can compare the timestamp intervals for new reports compared to reports received before you made your changes as shown in the following figure. (To see new reports received while this screen is being viewed, click the Sync. status icon.)
12. When you're ready to stop sending data:

```
# app stop redSensorToCloud
```

*Note: redSensorToCloud automatically closes the data connection, so you do not need to use "cm data connect -1".*

---

**A.1.3 Update and Install a New Application**

When you installed Legato, sample application files were also stored. In this section, you will build and then install the "hello world" application on the target.

**Build (compile) an application on the dev machine and install it on the target:**

1. On the dev machine, open a new terminal window.
2. Configure the window for development:
   
   ```
   $ cfglegato
   ```
3. Change directory to the sample application directory for Hello World:
   
   ```
   $ cd $LEGATO_ROOT/apps/sample/helloWorld
   ```
A.1.3: Update and Install a New Application

4. Compile the application.
   
   ```
   $ make wp85
   ```

   **Note:** This 'make' command uses the Makefile in the current directory to build only the sample application. It does not build the entire system like the 'make' command in Update an Installed Application on page 38.

5. Verify that the update file helloWorld.wp85.update was created:
   
   ```
   $ ls -al
   ```

6. Install the application on the target:
   
   ```
   $ app install helloWorld.wp85.update 192.168.2.2
   ```

   **Note:** This application will remain on the target until you either specifically remove it, or until the next time you reinstall the system on the target.

Log in to the target and run the application:

1. Set up a window to show the application’s output (the “Hello World” application writes to a log file) as follows:
   a. Open a new terminal window (referred to as LOG_TERM in this procedure).
   b. Connect to the target:
      ```
      $ ssh root@192.168.2.2
      ```
   c. Watch the log file and show when a message from "hello world" appears:
      ```
      # logread -f | grep "Hello"
      ```

      **Note:** Nothing will appear to happen until you run the Hello World application in the next step. Leave this command running until after you see the Hello World output, then you can press Ctrl+C to cancel it and return to the command prompt.

2. Run the application:
   a. Open a terminal window to run the application (referred to as APP_TERM in this procedure).
b. Connect to the target:
   
   ```
   $ ssh root@192.168.2.2
   ```

c. Check that the application is installed:
   
   ```
   # app status
   ```

   ![Hello World application]

   The "hello world" application should appear in the list with a status of 'running'. The application was built to run automatically; when you write your own applications, you can make them install without running, if you prefer.

d. Stop the application (so you can restart it and see the output):
   
   ```
   # app stop helloWorld
   ```

e. Run the application and see that it outputs a "Hello, world." message to the LOG_TERM terminal window:
   
   ```
   # app start helloWorld
   ```

   ![Hello World application]

   (Optional) If you want to see information about the application, enter the following command:

   ```
   # app info helloWorld
   ```
g. In the LOG_TERM terminal window, press Ctrl+C to return to the command prompt.
You have now successfully compiled a working application, and installed, stopped, and run it on the module.

**Note:** To learn more about the Legato development environment, visit [http://legato.io/legato-docs/latest/](http://legato.io/legato-docs/latest/).
B: Update Legato Application Framework

The Legato VM that you installed on your dev machine in Download Legato Application Development Image on page 15 was pre-configured with the latest version of the Legato Application Framework (AF).

When new versions of the framework are released, you can install them on your dev machine using the procedure below.

B.1 Update the Legato AF on Your Dev Machine

To update the Legato AF in the VM on your dev machine:

1. Open a terminal window.
2. Configure your environment for development:
   
   $ cfglegato

3. Check the version of the Legato AF that is currently installed:

   $ cd $LEGATO_ROOT/..
   $ ls -al .repo

   The installed version is indicated in the manifest.xml link.

4. Go to http://legato.io/legato-docs/latest/aboutReleaseInfo.html to get the version number of the most recent release.
B.1: Update the Legato AF on Your Dev Machine

5. If your release is older (lower version number) than the most recent release:
   a. Download the framework files into your working directory (for example, "legato_framework")—Replace the release number in the 'repo' command with the most recent release (this example downloads version 17.07.1):

      ![Image of command output]

      **Note:** Through the rest of this guide, "legato_framework" is assumed to be the file you created. If you used a different name, make sure to use that name in any commands that refer to legato_framework.

      i. Optionally, rename your existing legato folder so that you can restore the current framework if necessary at a later point (replace <version> with your current Legato AF version in the following command):

         
         
         $ mv legato legato_<version>

      ii. Download the framework files into the work directory and follow any prompts that may appear:

         $ repo init -u git://github.com/legatoproject/\manifest -m legato/releases/17.07.1.xml

         $ repo sync

         ![Image of command output]

         **Note:** This may take several minutes to run.
6. Build and install the Legato AF:

```bash
$ cd legato
$ make clean       # Optional step to remove clutter from previous builds
$ make wp85        # Build the framework
$ cfglegato        # Set up the environment
```

```
mango@mango-ThinkPad-X230:/legato_framework/legato$ make clean
Module: Wifi
Module: Dualsys
rm -rf build Documentation* bin doxygen.*.log doxygen.*.err
rm -f framework/doc/toolsHost.docx framework/doc/toolsHost*.dox
rm -f sources.md5

Input: /home/mango/legato_framework/legato/build/wp85/staging
Output: /home/mango/legato_framework/legato/build/wp85
Version: 17.67.1 4cd78a5 mango-ThinkPad-X230 2017/06/22 14:51:09
wp85: Generating the framework image (yaffs2)
wps5: Generating the framework cwe (yaffs2)

mango@mango-ThinkPad-X230:/legato_framework/legato$ echo $? 4
```
C: Tips

C.1 Finding your SIM’s APN

Your SIM provider should give you the APN that you use to connect to their network. If you don’t have the APN, you should be able to find it online.

If your mobile network operator uses different APNs for 3G and LTE, make sure to use the APN for the correct network based on your CF3 module type (e.g. WP8548 is a 3G-only module—the APN for the network operator’s 3G network should be used).

Examples:
- Sierra Wireless—internet.sierrawireless.com
- Rogers Wireless—internet.com (GPRS); Itemobile.apn (LTE)
- Others—Search the Internet for "<provider> APN". For example, "Rogers Wireless APN"

C.2 Using the Linux Terminal program

Ubuntu includes a terminal emulator, which is labeled as “Terminal” in the desktop environment. The emulator allows you to execute command-line programs that interact with the Legato framework tools on your dev machine and the CF3 module in the mangOH Red.

For this tutorial, here are some useful tips:

- Open a terminal window. For example, in the Unity desktop shell used by default on Ubuntu Linux, do this using either of these methods:
  - Click the Search icon and type "terminal", then run the application that is listed.
  - Press Ctrl+Alt+T
- Open a new tab in a window—Press Ctrl+Shift+T
- Change a tab name in a window—Right-click in the tab and select Set Title.
- Copy text from a window—Highlight the text and press Ctrl+Insert.
- Paste text into a window—Press Shift+Insert.
- For in-depth detail, refer to https://help.ubuntu.com/community/UsingTheTerminal.
### C.3 Useful commands for this tutorial (and more)

The following table describes the Legato and Linux commands used in this tutorial, plus other useful commands.

<table>
<thead>
<tr>
<th>Table C-1: Legato commands</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Command types</strong></td>
</tr>
<tr>
<td><strong>Versioning</strong></td>
</tr>
<tr>
<td><strong>Radio</strong></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td><strong>Refer to cm radio</strong> (<a href="http://legato.io/legato-docs/latest/toolsTarget_cm.html#toolsTarget_cm_radio">http://legato.io/legato-docs/latest/toolsTarget_cm.html#toolsTarget_cm_radio</a>) for more details and command options.</td>
</tr>
<tr>
<td><strong>Data connections</strong></td>
</tr>
<tr>
<td></td>

<tbody>
<tr>
<td>sudo</td>
<td>Allows you to run commands that require another user’s security privileges. In this tutorial, the sudo command is used to run commands that require root/admin privileges.</td>
</tr>
<tr>
<td>Legato Application Framework (AF)</td>
<td>Collection of daemons (Supervisor, Config tree, service directory, etc.), liblegato, and tools that provide a framework for developing and installing apps on modules (e.g. WP8548)</td>
</tr>
<tr>
<td>Legato Platform</td>
<td>Legato Application Framework, Platform services, and a toolchain (applications) running on top of a supported operating system (e.g. Linux or RTOS).</td>
</tr>
<tr>
<td>Platform Services</td>
<td>Collection of apps installed with the Legato Application Framework to provide connectivity to module hardware. Platform Services exposes APIs for developers to connect apps running on the hardware to the Cloud.</td>
</tr>
<tr>
<td>wget</td>
<td>Gets files from a web server</td>
</tr>
<tr>
<td>IDE perspective</td>
<td>A defined layout of the IDE. Each perspective will show different view (panel) combinations.</td>
</tr>
<tr>
<td>IDE view</td>
<td>A panel of information. For example, a directory structure, a panel for entering Terminal commands, etc.</td>
</tr>
</tbody>
</table>
C.5 VirtualBox Tips

C.5.1 Modifying resources

When you open a virtual machine (.ova) file, the Import Virtual Appliance window opens, showing the suggesting settings for VirtualBox. Before you click Import to load the VM into VirtualBox, you can adjust the CPU and RAM settings to fine-tune its performance if necessary.

To adjust the CPU or RAM value:

1. Double-click the value.

2. Type your new value and press Enter.

C.6 Enable virtualization on a Windows computer

1. Consult your computer’s BIOS manual (or search online for instructions) to find where your ‘Virtualization’ setting is stored. This may be called “Secure Virtual Machine”, “... Virtualization Technology”, etc., and may be under your Advanced, Config, Security, or CPU options (location varies by computer).
2. If you do not know how to boot directly into your computer’s BIOS, check online for instructions specific to your operating system. Some typical methods include:
   - Windows 7—Reboot the computer and press the appropriate key to go to the BIOS screen (for example, F2, Esc, Del, blue ThinkVantage on Lenovo machines, etc.)
   - Windows 8—Search online for “windows 8.1 bios access” for tips, and add your computer type to the search string to refine your results.
   - Windows 10—See http://acer.custhelp.com/app/answers/detail/a_id/37064/~/windows-10%3A-access-the-uefi-bios for details. You can also search online for “windows 10 bios access” for tips and add your computer type to the search string to refine your results.

3. Reboot the computer and go to the BIOS screen (press F2, Delete, etc.—whichever key is appropriate).
4. Go to the BIOS screen that has the Virtualization setting. This will currently be disabled. Change this to ‘Enabled’.
5. Save and Exit.
6. When the computer boots, open Virtual Box, go to System > Acceleration. and make sure both Hardware Virtualization options are selected.
7. You should now be able to launch the Legato 1604 VM.
# D: Hardware Tips

## D.1 Dipswitch Settings

The multi-function dipswitch block (SW401) is used to control module signals.

*Note:* The 'Default' switch positions are the settings recommended when using this guide.

<table>
<thead>
<tr>
<th>Signal</th>
<th>Dip</th>
<th>On/Off</th>
<th>State</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>PWR_ON</td>
<td>On (Default)</td>
<td>Enable CF3 module's POWER_ON signal</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Off</td>
<td>Disable POWER_ON signal</td>
</tr>
<tr>
<td>2</td>
<td>WIFI_UART1_TX</td>
<td>On</td>
<td>Enable CF3 module's firmware download (recovery) mode. Note: Similar functionality to TP1_BOOT</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Off (Default)</td>
<td>Normal operation</td>
</tr>
<tr>
<td>3</td>
<td>VCC_3V7_ULPM</td>
<td>On (Default)</td>
<td>While in ULPM, sensors receive power</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Off</td>
<td>While in ULPM, sensors are not powered</td>

</tr>
<tr>
<td></td>
<td></td>
<td>Off</td>
<td>When combined with HL_MODE, indicates that board is in HL mode.</td>
</tr>
</tbody>
</table>
E: Console Access

If you have two USB ports on your dev machine, you can use one of them to display the mangOH Red’s diagnostic messages when the device boots, when certain commands are run, etc.

To set up a window to display diagnostic messages:

1. Use a micro-USB cable to connect the mangOH Red’s CONSOLE USB port to a USB port on the dev machine.

2. Open a terminal window connected to the target’s Linux console as follows:
   a. Open Windows Device Manager, then expand Ports (COM &LPT) and check which COM port is used for the USB Serial Port.
      - network adapters
      - Ports (COM & LPT)
        - Intel(R) Active Management Technology - SOL (COM3)
        - Sierra Wireless AT Command Port (COM61)
        - Sierra Wireless DM Port (COM62)
        - Sierra Wireless NMEA Port (COM59)
        - USB Serial Port (COM72)
   b. Open a terminal window (e.g. PuTTY) connected to the mangOH Red’s console using the following settings:
      - Connection type = Serial
      - Serial line = [USB Serial port COM port]
      - Speed = 115200
c. Click Open. The window will remain empty until you power up the mangOH Red in the next step.

**Note:** Only one console connection can be opened at any time since it locks the USB serial port.

**Example**

If you open the console terminal window before you connect power to the mangOH Red, you will see the messages that are generated during the module boot process:
F: Removing/Inserting a CF3 Module

F.1 Removing a CF3 module

To remove a CF3 module from the mangOH Red:

1. Remove the module cover using the module cover removal tool—Starting at one corner, insert the tool in the pair of holes and carefully pry the cover away from the module.

2. Repeat at the other locations (pairs of pry holes are on each side).

3. Lift the cover off the module.

4. Carefully lift the module straight up out of the socket.
F.2 Inserting a CF3 module

To insert a CF3 module on the mangOH Red board:

1. Insert the CF3 module—Hold the module above the socket and line up the triangles on the module and socket. The module will drop straight into the socket. (Position matters!)

2. Hold the module cover over the module and line up the circle on the cover with the triangle on the label, then press the cover (on the edges) into place.

![Image of mangOH Red board with CF3 module inserted and cover over the module.]
G: Quick Reference—Commands in this Guide

The following table contains a list of the commands that are used in this guide with explanations of their purposes.

Table G-1: Commands Used in the Getting Started Guide

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>app install &lt;update_file&gt; &lt;ip_address&gt;</td>
<td>Install the specified file on the device at &lt;ip_address&gt;.</td>
</tr>
<tr>
<td>app start &lt;appname&gt;</td>
<td>Start (run) the specified application</td>
</tr>
<tr>
<td>app status</td>
<td>Display the status (running/stopped) of all installed applications.</td>
</tr>
<tr>
<td>app stop &lt;appname&gt;</td>
<td>Stop the specified application</td>
</tr>
<tr>
<td>cd &lt;directory&gt;</td>
<td>Change directory to the specified &lt;directory&gt;</td>
</tr>
<tr>
<td></td>
<td>Note: '~' is an alias of the user’s home directory.</td>
</tr>
<tr>
<td>cfglegato</td>
<td>This is an ‘alias’ that you set up in your ~/.bashrc file. The .bashrc is a</td>
</tr>
<tr>
<td></td>
<td>startup script that runs each time a new terminal window is opened. This is</td>
</tr>
<tr>
<td></td>
<td>a shortform command to run the longer series of commands needed to go</td>
</tr>
<tr>
<td></td>
<td>to the Legato AF directory and set up the environment variables used for</td>
</tr>
<tr>
<td></td>
<td>Legato development.</td>
</tr>
<tr>
<td>cm</td>
<td>Refer to <a href="http://legato.io/legato-docs/latest/toolsTarget_cm.html">http://legato.io/legato-docs/latest/toolsTarget_cm.html</a> for more</td>
</tr>
<tr>
<td></td>
<td>details and command options.</td>
</tr>
<tr>
<td>cm data</td>
<td>Display current connection status details (information about the current</td>
</tr>
<tr>
<td></td>
<td>profile).</td>
</tr>
<tr>
<td>cm data apn</td>
<td>Show the APN value currently being used for the SIM card.</td>
</tr>
<tr>
<td>cm data apn &lt;APN&gt;</td>
<td>Set the APN value to use for the SIM card.</td>
</tr>
<tr>
<td>cm data connect</td>
<td>Start a mobile network data connection.</td>
</tr>
<tr>
<td>cm data connect -1</td>
<td>Stop the mobile network data connection.</td>
</tr>
<tr>
<td>cm data pdp ipv4</td>
<td>Set the IP addressing method to IPv4.</td>
</tr>
<tr>
<td>cm info</td>
<td>Display the module’s model, IMEI, FSN (serial number), and firmware and</td>
</tr>
<tr>
<td></td>
<td>bootloader versions.</td>
</tr>
<tr>
<td>cm radio</td>
<td>Display the power status of the CF3 module’s radio (ON/OFF).</td>
</tr>
<tr>
<td>cm radio on</td>
<td>Power on the CF3 module’s radio.</td>
</tr>
<tr>
<td>cm sim info</td>
<td>Display information about the SIM.</td>
</tr>
<tr>
<td>echo &lt;parameter&gt;</td>
<td>Display the &lt;parameter&gt; information.</td>
</tr>
<tr>
<td></td>
<td>e.g.:</td>
</tr>
<tr>
<td></td>
<td>• echo $?—Display the error code returned by the previous command</td>
</tr>
<tr>
<td></td>
<td>(typically, '0' indicates the previous command completed successfully</td>
</tr>
<tr>
<td></td>
<td>(no errors))</td>
</tr>
<tr>
<td></td>
<td>• echo $LEGATO_ROOT—Display the pathname held in the</td>
</tr>
<tr>
<td></td>
<td>LEGATO_ROOT environment variable.</td>
</tr>
<tr>
<td>exit</td>
<td>Close the terminal window</td>
</tr>
<tr>
<td>Command</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>git pull</td>
<td>Retrieve any updates that have been made to the revision history of the remote git repository, and merge the current (local) branch with the corresponding remote branch.</td>
</tr>
<tr>
<td>git submodule init</td>
<td>Update the git configuration with any new submodules added recently.</td>
</tr>
<tr>
<td>git submodule update</td>
<td>Check out the version of the submodule specified by the current version of the parent repository.</td>
</tr>
<tr>
<td>instsys &lt;update_file&gt; &lt;ip_address&gt;</td>
<td>Install the specified file on the device at &lt;ip_address&gt;</td>
</tr>
<tr>
<td>logread -f</td>
<td>grep &quot;Hello&quot;</td>
</tr>
<tr>
<td>ls -al &lt;files&gt;</td>
<td>List details about the identified &lt;files&gt;.</td>
</tr>
<tr>
<td>make &lt;target_list&gt;</td>
<td>Build the programs for each listed target. Targets are named after module types and other unique features.</td>
</tr>
<tr>
<td></td>
<td>e.g.:</td>
</tr>
<tr>
<td></td>
<td>• wp85—Build for wp85 modules</td>
</tr>
<tr>
<td></td>
<td>• wp750x—Build for wp750x modules</td>
</tr>
<tr>
<td></td>
<td>• red_wp85—Build for wp85 modules used in mangOH Red boards</td>
</tr>
<tr>
<td></td>
<td>• green_wp85—Build for wp85 modules used in mangOH Green boards.</td>
</tr>
<tr>
<td>make clean</td>
<td>Remove 'build artifacts' (clutter left over from previous builds)</td>
</tr>
<tr>
<td>mv &lt;file&gt; &lt;destination&gt;</td>
<td>If &lt;destination&gt; is an existing directory name, move the &lt;file&gt; into that directory. Otherwise, rename the &lt;file&gt; using the &lt;destination&gt; name.</td>
</tr>
<tr>
<td>ping &lt;ip_address&gt;</td>
<td>Test the connection between the device and the a network host at &lt;ip_address&gt;.</td>
</tr>
<tr>
<td>repo init -u git:&lt;path&gt; -m &lt;manifest&gt;</td>
<td>First, clone the manifest repository indicated by <code>-u</code> option (e.g. git://github.com/legatoproject/manifest). Then use the &lt;manifest&gt; located in that cloned repository to clone and check out the specified version of each repository in the manifest.</td>
</tr>
<tr>
<td>repo sync</td>
<td>Get the latest updates for all git repositories and perform all updates allowed by the manifest.</td>
</tr>
<tr>
<td>ssh root@&lt;ip_address&gt;</td>
<td>Log in as the root user to the device at &lt;ip_address&gt;.</td>
</tr>
